

IN THE ABSTRACT

Page 12, lines 2-10 have been amended as follows:

A ~~selective one-way~~ bit-driving apparatus is provided between a handle and a bit. The ~~selective one-way~~ bit-driving apparatus includes a hollow shaft and a bit receiver. The hollow shaft includes a first section for connection with the handle and a second section. The bit receiver includes a first space for receiving the second section of the hollow shaft and a second space for receiving the bit. The hollow shaft drives the bit receiver ~~in selective one of two directions~~ through a ~~selective one-way~~ driver. At least one connector connects the internal wall of the first space of the bit receiver with the periphery of the second section of the hollow shaft.
